Scenario:

Build a simple pizza ordering system. Where a customer can order 3 types of pizza and choose multiple toppings.

Task:

Complete the PHP code below with the following requirements:

Variables:

Total price of the order

Number of toppings added

Whether the order is complete or not

Switch Statement:

Case 1: Margherita ($5)

Case 2: Pepperoni ($10)

Case 3: Veggie Supreme ($15)

While Loop: Create a while loop that allows customers to add toppings:

Each topping costs $2

Maximum 5 toppings allowed

Order Summary: Display the final order summary including pizza type, number of toppings, and total price.
